Morbidity and Mortality

PUBLIC HEALTH SERVICE U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Prepared by the NATIONAL OFFICE OF VITAL STATISTICS Executive 3-6300, Ext. 4744

For release December 18, 1959

Washington 25, D. C.

Vol. 8, No. 49

Provisional Information on Selected Notifiable Diseases in the United States and on Deaths in Selected Cities for Week Ended December 12, 1959

Incidence of paralytic poliomyelitis continues to be higher than last year. For the current week a total of 110 cases, of which 85 were paralytic, was reported as compared with 89 and 59, respectively, for the same week in 1958.

Five cases of diphtheria were reported in Kansas for the current week. These are the first cases reported in that State this year. The cumulative total number of cases of diphtheria for the United States continues to be slightly higher than in 1958, but the total during the present disease year is somewhat less than for the preceding disease year.

EPIDEMIOLOGICAL REPORTS

Salmonellosis

Robert M. Scott, Illinois State Department of Public Health, investigated an outbreak of salmonellosis following a church supper. The food was supplied by a special catering service

which served turkey, dressing, mashed potatoes, and gravy. The food was served cafeteria style and the youth group of the church waited on tables with rolls, coffee, and additional helpings of various foods. Twenty-five of 200 persons attending the supper became ill with symptoms of nausea, vomiting, chills, fever, and diarrhea from 5 to 6 hours after eating. No food samples were available for laboratory study. Salmonella oranienburg was isolated from a stool specimen from 1 person. It was reported that all the affected persons were seated in

F. A. Listick, Los Angeles City Health Department, reported that 37 of 40 persons eating the suspect food, beef roulades, became ill from 12 to 35 hours after eating a meal on board an airplane. Stool specimens were obtained from 32 ill persons and 17 of these were found to be positive for Salmonella typhimurium. Specimens were also obtained from

Data show no pronounced seasonal change in incidence.

²Includes 36 cases of aseptic meningitis; see footnotes to table 2.

EPIDEMIOLOGICAL REPORTS-Continued

90 foodhandling personnel at the airline's flight kitchen. Only 1 employee gave a positive specimen and this was identified as S. typhimurium. This foodhandler had a history of having stomach cramps and constipation about a month prior to the outbreak. This was thought to be an illness due to nervousness. The foodhandler worked with the already cooked beef roulades, placing them into casserole dishes.

Gastroenteritis

Mr. P. M. Manson, Tulare County Health Department, California, reported an outbreak of gastroenteritis in which 40 persons became ill. The suspected vehicle was turkey and dressing served to about 600 persons. The turkeys were removed from a locker plant to a hall where they were stuffed and taken to a bakery to be roasted. The turkeys were sliced in the morning and then held in warmers at a relatively low temperature until evening when they were served at a banquet. Some leftovers were served the next day to schoolchildren who did not become ill. The outbreak was reported 2 days after occurrence of the illness. Many coagulase-negative staphylo-

cocci were isolated from specimens of the turkey meat and dressing. However, the significance of the laboratory findings are considered to be equivocal since the food was unrefrigerated for a long time before specimens were obtained. Ample evidence of poor food-handling practices were evident during the investigation.

Staphylococcal food poisoning

The Los Angeles County Health Department has reported the occurrence of 5 cases of food poisoning in 2 families whose members had eaten cake with a custard filling. Each family had purchased a cake made in a single bakery. The incubation period was 3 to 5 hours. Coagulase-positive hemolytic staphylococci were isolated in numbers too numerous to count from the cake filler which was made with sugar, whole eggs, starch, and butter. The cakes were not refrigerated after icing or during the period of delivery.

QUARANTINE MEASURES

<u>Immunization Information for International Travel</u>
No changes reported.

Table 2. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES, EACH DIVISION AND STATE, HAWAII, AND PUERTO RICO, FOR WEEKS ENDED DECEMBER 13, 1958, AND DECEMBER 12, 1959

²Includes 10 cases of aseptic meningitis.
⁵Includes 2 cases of aseptic meningitis.

³Aseptic meningitis.

⁴Includes 4 cases of aseptic meningitis.

The chart shows the number of deaths reported for 114 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week and an adjusted average, 1954-58, for comparison. The adjusted average is computed as follows: From the total deaths reported each week for the years 1954-58, 3 central figures are selected by eliminating the highest and lowest figures reported for that week. A 5-week moving average of the arithmetic means of the 3 central figures is then computed. The adjusted average shown in the chart is this moving average increased by 2.3 percent to allow for estimated population growth in the cities.

The use of the adjusted average is based on the assumption that the crude death rate and changes in population will remain at the level of recent years. No allowance has been made for increased use of city hospital facilities.

Table 4 shows the number of death certificates received during the week indicated for deaths that occurred in a specified city. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week an estimate is made for use in plotting the figure in the chart.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations, and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

Table 3. DEATHS IN 114 SELECTED CITIES BY GEOGRAPHIC DIVISIONS

EXPLANATION OF SYMBOLS USED IN TABLES

Data not available	
Quantity zero	100
Percent more than 0 but less than 0.05	0.0
Disease stated not notifiable	
Figures within parentheses not included in totals	()

SOURCE AND NATURE OF MORBIDITY DATA

These provisional data are based on reports to the Public Health Service from health departments of each State and of Hawaii and Puerto Rico. They give the total number of cases of certain communicable diseases reported during the week usually ended the preceding Saturday. Cumulative totals are routinely revised to include corrected and revised figures and delayed reports. In table 1, data for Alaska are included for 1959 but not for prior years. In table 2, total figures for the United States and the Pacific Division include figures for Alaska for 1959 only. Cases of anthrax, botulism, and rabies in man are not shown in table 2, but a footnote to table 1 shows the States reporting these diseases. When diseases of rare occurrence (cholera, dengue, plague, louse-borne relapsing fever, smallpox, louse-borne epidemic typhus, and yellow fever) are reported, this will be noted below table 1.
